Computers, portable electronic devices, and other types of electronic equipment often include memory devices such as random access memory (RAM) devices, erasable programmable read only memory (EPROM) devices, electrically erasable programmable read only memory (EEPROM) devices, or the like. As the performance and functional capabilities of these various devices continue to improve, manufacturers seek ways to make them smaller, faster, and energy efficient. Memory devices are an example of such a device because they are frequently one of the key components used to provide a non-volatile memory function. To that end, there is a continuing effort to increase the memory capabilities of memory devices. An important part of any memory device are memory cell arrays that include rows and columns which serve the dual functions of selecting a memory cell for writing to, reading from, or erasing. One type of a memory cell array is a dynamic random access memory (DRAM) cell array. An array of memory cells, such as a DRAM memory cell array, typically includes intersecting rows and columns of conductive material. Each memory cell includes a capacitor adapted to hold a charge representing either a logic high or logic low. The charge, or lack thereof, is representative

"The Saracens are often dubbed the people of the stars. They are the first to discover the genetic potential of terraforming, and were among the first to colonize." "Their most distinguishing feature is a lack of a defining culture or religion. Forming a unified society

through the advancement of technology, the Saracens are masters of starship technology and the application of science to achieve their goals. The Saracens' desire for natural resources and dominance in trade has led them into a relationship with the other empires of the galaxy, but have left their identity relatively unchanged. Who can be trusted? What is right? What is wrong? Play it right, and the Saracens will drive their planet to ecological and cultural oblivion. Do it wrong, and the Saracens will resort to nuclear war to achieve their goals."

Game-Play 1 Features: The game-play starts in the stand. When you start playing, it makes a sound and the "Start Game!" music begins playing. The game-play is initiated with the left bumpers. The left bumper is used to move from the stand to the playfield; the right bumper is used to

activate/deactivate the game-play. The bumpers are in the same position as on the table "Project-SARACEN" on the manufacturer's packaging. All objects in the game-play are located on the right playfield. The game-play consists of 3 sections: start game, gaming stage, and bonus round. Game-Play 2 Features: On the left side of the stage we see the silhouette of a man playing a piano, which represents the coin for gambling in the casino. On the right side, there are close-up shots of the roulette dealer (red) and craps (shooting dice) bets. In the game-play, the numbers 1 to 7 as well as a double "seven" appear. It is against the rules to use numbers 2-7 or double 7. The red double "seven" appears for the first time on the left playfield. The red double 7 appears on the left playfield for the first

time. The game-play ends with the right bumper. Some minor differences in the game-play: It takes you into the bonus round of 1,000 points in the "Project-SARACEN" only after 7,000 points were won in the "Project-SARACEN". It takes you into the bonus round of 1,000 points in the "Pinball Champ" only after 2,500 points were won in the "Pinball Champ". Game-Play 3 Features: The upper right is a special "cumbersome" state, which can be reached after winning several games. The objectives are gaining money and record the winning numbers. The goal is to play a record-matching top in the bonus round. The stage starts with the left bumper and switches to the right playfield. The right playfield functions for betting. The top of the screen is divided into ten sections of 0.1 points. A number of values are

displayed (which are not displayed to the players during the game-play) in these sections. The middle section of the screen displays the number of games in which you won (how much you won

PROJECT PORTFOLIO - Coastal and under ground Project information PORTFOLIO PROJECT OVERVIEW An Update on two new underwater oil exploration projects in Kuwait. Summary Two new exploration projects are due to begin in 2012. They are being developed in parallel and will culminate in the development of a possible 200,000 barrel per day oil installation (200 mm bopd) and construction of an associated pipeline at a ship break at the ports of Umm Al Aliyah and United Aljomaih. The duration of the projects is between two and three years with possible extension of one or both work packages. Project Description The project will exploit an area of potential oil sedimentation(USGS) in deep water on the coast of Kuwait, approximately 11km due west of the Umm Al Aliyah stratum. The project has been selected by a selection committee appointed by

the National Petroleum Company on behalf of Kuwaiti Amiri. The project is being performed by Kuwait Petroleum Corporation, with the full support of the National Petroleum Company. There will be two wells drilled. One is a horizontal well and the other is a vertically oriented sub-sea completion. At the surface the project involves installation of a mechanized drilling rig. Drilling this deep takes a lot of time and an enormous amount of very expensive equipment. The chances of exploration success at a depth of 3,310 m depend to a large extent on factors such as: the rock type, the geological overburden and the state of the ecosystem. The typical oil on the sea floor is believed to be a substance called oil shale and then derived oil (light oil that isn't refined). The most amazing thing about sedimentary rock is that, if it's under water, most of its floor is usually composed of calcium carbonate. This kind of rock tends to dissolve readily, coming out of solution forming layers (called carbonatic) with seepage of petrol. This is the rock type where the wells are being drilled. This is the location of the proposed well sites. The proposed well sites are about 7km southwest of the proposed onshore ship break (United Aljomaih). To the west of this, the bathymetry changes into a more chaotic zone of sedimentary rock. On the shore, the coastline is generally low and sandy.

The tidal fluctuation of up to 2 metres is likely
